"Conorfamide, a Conus venom peptide belonging to the RFamide family of neuropeptides.";
Submitted (APR-2002) to the SWISS-PROT data bank.

-!- FUNCTION: Has antibacterial activity against Gram-positive bacteria and antibacterial activity against S.cerevisiae.
-!- SUBGNIT: The nucleosome is an octamer containing two molecules of H2A, H2B, H3, and H4; which wrap approximately 146 bp of DNA.
-!- SUBGELUCIAN LOCATION: Nuclear.
-!- MASS SPECTROMETRY: MW-13639; METHOD-MALDI.
-!- SIMILARITY: BELONGS TO THE HISTONE H2A FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -i- SUBCELLUIAR LOCATION: Secreted.

"Characterization of a 3 alpha-hydroxysteroid dehydrogenase/carbonyl reductase from the Gram-negative bacterium Comamonas testosteroni.";
Eur. J. Blochem. 241:744-749(1996)
IEUR. J. BLOCHEM. 241:744-749(1996)
INCLION: ALONG WITH THE 3 ALPHA-HYDROXYSTEROID DEHYDROGENASE AND 3-OXO-REDUCTASE ACTIVITIES TOWARDS A VARIETY OF CIS OR TRANS FUSED AF RING STEROIDS, IT ALSO REDUCES SEVERAL XENOBIOTIC CARBONYL COMPOUNDS; INCLIDING A METYRARONE-BASED CLASS OF INSECTICIDES, TO THE RESPECTIVE ALCOHOL METABOLITES.
-I- CATALITIC ACTIVITY: Androsterone + NAD(P)(+) = 5-alpha-androstane-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3,17-dione + NAD(P)H.

"Primary structure and biological activity of bradykinin potentiating heptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:21-227 (1990).

-1- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANGOTERNIA-CONVERTING FURNEME AND ENHANCES THE ACTION OF BRADXKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Queimada jararaca).
